

de nouveau le module en mode de configuration, sélectionnez le niveau de variation minimal (appuyez de 5 à 8 fois). Vous trouverez une liste des lampes testées sur la fiche technique des variateurs.

4. Données techniques

Pour plus de détails, consultez les fiches techniques sur www.qbus.be. Vous trouverez les caractéristiques communes ci-dessous.

CARACTÉRISTIQUES TECHNIQUES GÉNÉRALES :

- Alimentation : 230 Vac +/-10%, 50 Hz – protection maximale 16 A/2 P
- Température ambiante de fonctionnement : de 10°C à 50°C
- Taux d'humidité maximal : 93%, pas de condensation
- Charge du bus : 10 mA en cas de tension nominale de 13,8 V
- Fusible interne : 500 mA T monophasé

SORTIES :

- DIM04/02 : OUT1 – OUT2/4 : sorties à intensité variable pour ampoules à incandescence (10-500 VA), halogènes (avec transformateur magnétique max. 400 VA), LED 230 V à intensité variable et ampoules économiques à intensité variable (min. 10 VA, max. 100 VA dans les deux cas).
- ANR04SA:

- Relais 1 – 4: 4 contacts N.O. libres de potentiel, courant max 16A. En Mode Variateur ou PWM. Le relais suit le variateur: relais se désactive lorsque la sortie est à 0V. Mode Relais: MARCHE/ARRÊT.
- ANA/PWM 1 – 4 : 4 sorties analogiques. Chaque sortie max 4mA Source, max 20mA Sink.

ENTRÉES :

- 1-A : 5 (ou 3) contacts libres de potentiel ; par défaut bouton-poussoir.

CARACTÉRISTIQUES PHYSIQUES

- Boîtier : plastique, auto-extinguible, conforme à UL94-V0
- Degré de protection : IP20, EN60529
- Largeur DIM02SA, ANR04SA = 6 modules ; DIM04SA = 9 modules

PROTECTION ÉLECTRIQUE

- Bus : 13,8 Vdc basse tension
- Conforme à EN60950 1:2006
- Tension en circuit ouvert : le module a été testé et approuvé sur 3k Vac (50 Hz, 1 min)
- Non toxique, conforme à WEEE/RoHS
- Conforme aux réglementations relatives à la CEM et à la basse tension. Le module est conforme aux normes HBES – EN50090-2-2 et EN60950-1:2006.

5. Conditions de garantie

Durée de garantie standard : 2 ans à compter de la date de livraison. Extension de la garantie : 2 ans si le module est installé par un installateur électrique agréé ou par un guide en installation agréé par Qbus et si la carte de garantie a été renvoyée, dumment complétée, à Qbus, dans un délai de 2 mois à compter de l'achat du module. La garantie est annulée si le module a été ouvert !

English

1. Product description

These dimmer modules are part of the Qbus Stand-Alone (SA) range and can both work Stand-Alone or can be connected to a Qbus controller to then be part of a complete Qbus home automation installation.

The **DIM04SA** and the **DIM02SA** (hereafter **DIM0XSA**) dim respectively 4 and 2 circuits of 10-500VA. The dimmer can be used for light bulbs, halogen lamps, capacitive and inductive charge, dimmable 230V LEDs and dimmable energy-saving light bulbs. By default, the outputs on the Dimmer modules are set for Conventional transformers as standard, with a minimum dimming level of 10%.

The **ANR04SA** is suitable for controlling four analog dimmers (0/1-10V or PWM) or relays (16A each) or a combination of both. Each analog dimmer controls a relay contact which switches off when the analog dimmer is at 0%. By default, the outputs of the **ANR04SA** are in Dimmer mode, with a 10% minimal dimming level.

The Stand-Alone (SA) modules have potential-free inputs for the connection of standard buttons. Input 1 to 4 operates outputs 1 to 4, input 1 is a "scenario" input that when pressed 0.7 seconds (and then releasing) carries out an EVERYTHING OFF scene, and when pressed for 3 seconds functions as a PANIC BUTTON operating an EVERYTHING ON scenario. As default, the inputs are set as push buttons.

When the SA modules are used with a Qbus Controller, the function of the inputs and the outputs can be adjusted via the Qbus configuration software. It is also possible to configure the SA modules via a Qbus controller and then remove the Controller. That way, the outputs can be set to stand-alone mode with a delay ON, delay OFF or time OFF (=Timer 1) function.

2. Safety instructions

Read the complete instructions before installing the module and activating the system.

ATTENTION

- The module must be installed, started and maintained by an authorized electric installer according to the valid legal regulations of the country.
- This module is suitable only for DIN rail installation EN50022. The module must be installed in a fire-resistant closed distribution box with ventilation grids.
- Before working on the modules the power must be switched off.
- The guarantee expires if the module is opened!

3. Installation and wiring

See below for cabling diagrams and options.

INSTALLATION:

Click the module on a DIN-rail DIN EN50022.

INPUTS AND LED OUTPUTS:

Strip approximately 7mm insulation from the cable and push the cable into the terminals 1-A. Both solid and stranded wire from 0,5 – 1,5 mm² can be used.

External 24V supply can be connected to the SA modules to give LED feedback on the buttons via the LED outputs.

LOAD CIRCUITS

WARNING: the relay outputs of the ANR04SA are POTENTIAL FREE contacts! Connect the loads to the output connectors. Conductor cross section minimum 1.5 mm². Remove approx. 7mm insulation from the conductor and screw it in the terminals OUT1 - OUT4. If sockets are connected to a relay a separate contactor must be connected (2P/20A contactor is required).

POWER SUPPLY:

A bi-polar automatic fuse of maximum 16A must be connected on the module supply of 230 VAC. Conductor cross-section: minimum 1,5 mm². Remove approx. 7mm insulation from the conductor and screw the conductor in the connector L-N.

LED INDICATION ON THE MODULE

Green: power supply.

Red: 2 seconds during start-up and then during programming. This LED will also blink when choosing the load, minimum dimlevel and mode. Refer to Manual Operation for more details.

Orange OUT1-4: output active. Flashing (DIM0XSA) = output in protection. Turning the output off will get it out of protection.

MANUAL OPERATION

DIM0XSA

Manual operation is used to directly operate the output from the module, or to select the respective charge and minimum dimming level if the dimmer is used Stand-Alone. To select the connected charge the following procedure must be followed:

- Ensure that all outputs are OFF (= all orange LEDs are off).
- Press buttons 1 and 2 simultaneously for four seconds. The red LED STATUS on the module will blink quickly for 5 seconds and then start blinking at another speed.
- 2 seconds after the LED STATUS starts blinking at another speed, release 1 button, and 2 seconds later release the other. The red LED STATUS now continues blinking: the module is in configuration mode.
- The outputs are set for Conventional transformers as standard. If other charges must be dimmed, they can be selected by pressing the button under that output for a few times. The orange LED lights up every time the button is pressed. See table below - the number of times for pressing the button is indicated next to the type of charge.

Load	choice
Conventional transformers	1
Electronic transformers	2
Incandescent lamps	2
Halogen lamps 230 V	2
Retrofit led 230V (preferable)	2
Retrofit led 230V (alternative)	1
CFL with 100% startup (preferable)	3
CFL with 100% startup (alternative)	4

If you do not press the buttons for 4 seconds, the module will get out of the configuration mode - the red LED STATUS will stop blinking.

- The minimum dimming level can also be set in Stand-Alone mode. Follow step 1) to 4) to get into configuration mode. See in the table below how many times you need to press for which minimum dimming level.

Low Dimming Limit (DimMin)	choice
0%	5
10%	6
20%	7
30%	8

- The memory function means that the dimmer remembers what the set value was when turning the dimmer off. Example: If the dimmer is set to 60% on power off, the light will automatically turn on 60% when switched on. See table below to find out how many times the button needs to be pushed to activate/deactivate the memory function: See table below to find out how many times the button needs to be pushed to activate/deactivate the memory function:

Memory function	choice
Memory function off	9
Memory function on	10

If one of the buttons is pressed during setup mode for 5 seconds, the respective channel goes into **DEFAULT mode (= Conventional transformers and 10% minimum dimming level)**. A successful reset is indicated by 10 times FAST blinking of the led of the channel. The set up mode remains active.

ANR04SA

Manual operation is used to control the output directly from the module, or to choose the output mode (Dimmer, Relay or PWM) and to set the minimum dim level of a dimmer or PWM output. Follow the following procedure:

Follow steps 1 to 4 described above under the Manual Operation of the Dimmer module in order to get in to configuration mode.

- The outputs are standard in Dimmer mode. Changing to Relay or PWM mode can be done by pushing the button under the respective output a certain number of times. The orange LED next to the button will flash each time the button has been pushed. The table below indicates how many times the button needs to be pushed to get in to the respective mode:

Mode	choice
Dimmer	1
Relais (ON/OFF)	2
PWM Invers	3
PWM Positive	4

If during 4 seconds the button has not been pushed, the module will go out of configuration mode - the red Status LED will stop flashing.

- For Dimmer and PWM outputs, the minimum dim level can also be set via the buttons on the module. Follow steps 1 to 4 above to get into the configuration mode. The table below indicates the number of times the button below the respective output needs to be pushed in order to select the minimum dim level indicated.

Low Dimming Limit (DimMin)	choice
0%	5
10%	6
20%	7
30%	8

If one of the buttons during configuration mode is pushed for 5 seconds, the respective output will be reset to the Default mode (Dimmer with 10% minimum dim level). A successful reset will result in the LED of the output flashing quickly for 10 times. The setup mode remains active.

NOTE: selecting the charge and minimum dimming level must be done in SEPARATE steps. Select the charge (press 1 to 4 times), exit configuration mode, then go back in configuration mode, then select minimum dimming level (press 5 to 8 times).

You will find a list of tested lamps in the technical sheet of the Dimmers.

4. Technical Data

See the respective technical sheets on www.qbus.be for the details. The common features are indicated below.

GENERAL SPECIFICATIONS:

- Power supply: 230 VAC +/-10%, 50 Hz - maximum protection 16A/2P
- Operational ambient temperature: 10°C to 50°C
- Maximum humidity level: 93%, no condensation
- Bus load: 10 mA at rated tension 13.8 V.
- Internal fuse: 500mAAT mono phased.

OUTPUTS:

- DIM0XSA: dimmable outputs for light bulbs (10-500VA), halogen lamps (with magnetic transformer max 400VA), dimmable 230V LEDs and dimmable energy saving lamps (both min 10VA, max 100VA).

- ANR04SA:
 - OUT1-4: Relays 1 – 4: 4 potential-free normally open single contacts, max. 16A. If outputs are in Dimmer or PWM mode, the relay will follow the Dimmer (0% = relay off, otherwise relay on). If output is in Relay Mode, the output is ON/OFF
 - ANA/PWM 1-4: 4 analogue outputs. Each output max. 4mA Source, max 20mA Sink.

- INPUTS:**
 - 1-A: 5 (or 3) potential free contacts. By default set as push button.

PHYSICAL SPECIFICATIONS

- Casing: Plastic, self-extinguishing according to UL94-V0
- Protection level: IP20, EN60529
- Width DIM02SA, ANR04SA = 6 modules. DIM04SA = 9 modules.

ELECTRIC SAFETY & CE

- Bus: 13.8 VDC low tension
- According to EN50491-5-1, EN50491-5-2, 60950-1 and 60529
- Breakdown voltage: module is tested an approved for 3kVac. (50 Hz, 1 min)
- Non-toxic according to WEEE/RoHS

5. Guarantee provisions

Standard Warranty Period: 2 years from date of delivery. Extra Warranty: if installed by an electrical installer or recognized Qbus advisor and if the warranty card has been completely filled out and sent back to Qbus within 2 months, guarantee is extended for two additional years. Guarantee will not be accepted if the device has been opened!
